Abstract The Marfan syndrome (MFS), initially described just over 100 years ago, was among the first conditions classified as a heritable disorder of connective tissue. MFS lies at one end of a phenotypic continuum, with people in the general population who have one or another of the features of MFS at the other end, and those with a variety of other conditions in between.

*The Marfan Syndrome | Annual Review of Medicine*

Marfans Syndrome A Review Mag Online Library Marfan syndrome (MFS), a rare, complex, and potentially life-threatening connective tissue disorder, affects one in every 5,000 Americans. Marked by a constellation of disease manifestations, including skeletal dysfunction, ocular lens dislocation, and, most troubling, aortic dilatation and aneurysm, MFS is challenging to diagnose because its ...

## *Marfans Syndrome A Review Mag Online Library*

Marfan syndrome is an autosomal dominant heritable disorder of fibrous connective tissue due to mutation in the fibrillin-1 gene, located on chromosome 15. Early mortality from Marfan syndrome results from aortic dilatation. The medical literature contains long-term follow-up series of patients with ...

## *Marfan syndrome: literature review of mortality studies*

Marfan is caused by a mutation in the gene that tells the body how to make a protein called fibrillin-1. This protein is important in making connective tissues, which are found throughout the body.

# Read Free Marfans Syndrome A Review Mag Online Library

Marfan syndrome is a disorder of the body's connective tissues, a group of tissues that maintain the structure of the body and support internal organs and other tissues. Children usually inherit the disorder from one of their parents. Some people are only mildly affected by Marfan syndrome, while others develop more serious symptoms.

## *Marfan syndrome - NHS*

Marfan syndrome is an autosomal dominant, multisystemic connective tissue disease, associated with a mutation in fibrillin, and occasionally a mutation in TGFBR1 or 2.<sup>1,2</sup> The cardinal manifestations of this condition involve the cardiovascular, ocular and skeletal systems.<sup>3</sup> The prevalence of Marfan syndrome is

## *Marfan Syndrome: A Case Study*

Marfan syndrome is a genetic disorder that affects the connective tissue. Those with the condition tend to be tall and thin, with long arms, legs, fingers, and toes. They also typically have overly-flexible joints and scoliosis. The most serious complications involve the heart and aorta, with an increased risk of mitral valve prolapse and aortic aneurysm. The lungs, eyes, bones, and the covering of the spinal cord are also commonly affected. The severity of the symptoms of MFS is variable. MFS i

## *Marfan syndrome - Wikipedia*

Marfan syndrome can sometimes affect the natural position of the chest. Your chest is concave if it caves inwards, and convex if it protrudes outwards. In rare cases, a person's chest can be severely concave and press against their lungs, affecting breathing. Surgery will usually be required to help ease the pressure on the lungs.

## *Marfan syndrome - Treatment - NHS*

March 1, 2020 Marfan's syndrome is a systemic connective tissue disease that is inherited. It is characterized by abnormalities of the

skeletal, cardiovascular and ocular systems predominantly. It also can involve the eyes and lungs.

## *Marfan's Syndrome / Broker World*

Marfan syndrome is an inherited condition that affects connective tissue, which provides the structural framework that holds the body's cells in place. People with Marfan syndrome are often very tall. The condition can also affect the joints, spine and eyes. But the most serious complications of Marfan syndrome are caused by weak blood vessels - in particular, weakness of the 'aortic root'.
