Tenenbaum and Pollard's "Ordinary Differential Equations," chapter 1, section 4, problem 29 asks for a differential equation whose solution is "a family of straight lines that are tangent to the circle  $x^2 + y^2 = c^2$ , where  $c$  is a constant." Since the solutions will be lines, I start with the formula  $y = m x + b$ , and since the line is determined by a single parameter (the point on the circle to which the line is tangent) I expect the differential equation to be of order one.

The solutions of ordinary differential equations can be found in an easy way with the help of integration. Go through the below example and get the knowledge of how to solve the problem. Question 1: Find the solution to the ordinary differential equation  $y''=2x+1$ . Solution: Given,  $y''=2x+1$ . Now integrate on both sides,  $\int y' dx = \int (2x+1)dx$

The answer is yes; the ODE is found by differentiating the equation of the family (5) (using implicit differentiation if it has the form (5b)), and then using (5) to eliminate the arbitrary constant  $c$  from the differentiated equation. Example 1. Find a first-order ODE whose general solution is the family (6)  $y = c x^7/c$  ( $c$  is an arbitrary ...
