Sensor elements' resistances can range from less than 100 Ω to several hundred k Ω , depending on the sensor design and the physical environment to be measured (See Figure 2.1). For example, RTDs (Resistance Temperature Devices) are typically 100 Ω or 1000 Ω . Thermistors are typically 3500 Ω or higher.

Conversely, in sensor-type measurements, R_4 may be a fixed reference, and a null occurs when the magnitude of the external variable (strain, temperature, etc.) is such that $R_1 = K \cdot R_4$. Null measurements are principally used in feedback systems involving electromechanical and/or human elements.
