The three voltages generated by the alternator-2 must be in phase with the respective voltages of the bus bar (or alternator-1). This is achieved by maintaining the same phase sequence and frequency of alternator-2 with bus bar or alternator-1. For achieving these relationships, synchronizing lamps technique is used. Three-phase electric systems may have a fourth wire, called "neutral." The "neutral" wire of a three-phase system will conduct electricity if the source and/or the load are unbalanced. In three-phase systems two sets of voltages and currents can be identified. These are the phase and line voltages and currents.
